

Title: Reconnaissance and Vulnerability Scanning Report

Objective:

To perform active reconnaissance and vulnerability scanning on a safe test system using Nmap and Nikto.

Tools Used:

- Kali Linux
- Nmap
- Nikto

Target Used:

- scanme.nmap.org
- <https://demo.testfire.net>

Procedure:

1. Opened Kali Linux terminal.
2. Installed and verified Nmap and Nikto tools.
3. Performed service and port enumeration using Nmap.
4. Conducted advanced scanning using Nmap.
5. Performed vulnerability scanning using Nikto on a safe demo website.
6. Collected scan results and screenshots for analysis.

Commands Used:

```
nmap -sV scanme.nmap.org  
sudo nmap -A scanme.nmap.org  
nikto -h https://demo.testfire.net
```

Findings:

- Target host was reachable.
- Open ports and running services were detected.
- Port 80 (HTTP) was found open.
- SSH service was identified on the target system.
- Web server headers and server information were identified.
- Nikto scan was completed successfully.
- No CGI directories were found during scanning.
- Basic security observations and possible risks were identified.

Conclusion:

The reconnaissance and vulnerability scanning task was successfully completed using Nmap and Nikto. The scan helped identify active services, server details, open ports, and basic security observations on the target system. This task provided practical experience in information gathering and vulnerability assessment using industry-standard cybersecurity tools.
